. . .

The Tobacco Situation is published in March, June, September, and December.

SUMMARY

Prospects for domestic use and exports of tobacco remain reduced and total disappearance for 1970/71 may barely equal the 1970 crop of 1.9 billion pounds. This would leave about 3.7 billion pounds carryover at the end of the season, much the same as a year earlier.

For the 1971 crop, tobacco growers expect to reduce plantings for harvest about 6 percent from the 899,000 acres harvested last year. A decline of 44,000 acres is in prospect for flue-cured due in part to the lower farm quotas. Burley growers intend 9,800 fewer acres

Average yields, allowing for trends on the prospective tobacco acreage would result in a crop of around 1.7 billion pounds, a tenth less than last year. The smaller crop plus an expected carryover about unchanged would give a supply 3 percent smaller than the 5.57 billion pounds for 1970/71. Since the crop would be about 5 percent below estimated requirements for 1971/72, the carryover would decline.

Last year's output of cigarettes, which account for most of the tobacco used in the United States, rebounded to a record 583 billion. The total was up 4 percent from 1969. Filter-tip cigarette output rose to 80 percent of the total. Nonfilter-tip production declined.

In 1970, U.S. smokers used 538 billion cigarettes—2 percent more than the previous year. Adult per capita consumption held its own at 4,000 cigarettes (200 packs). Total consumption in 1971 may hold at last year's level or increase slightly. Sales of cigars and smoking tobacco are gaining.

In the second half of 1970, domestic use of U.S. tobacco was 4 percent below a year earlier, despite a 7 1/2 percent jump in cigarette production. Total domestic use for the 1970/71 marketing year is now placed at 1.29 billion pounds, about 4 percent below last year.

U.S. exports of tobacco and products reached \$679 million in calendar 1970, the second highest on record. Volume declined but prices advanced. Unmanufactured tobacco exports were worth \$488 million and tobacco product exports reached a record \$191 million. Volume of unmanufactured tobacco totaled 510 million pounds (equivalent to about 570 million pounds, farm-sales weight). This was about 12 percent below 1969.

For the current fiscal year, exports may fall 10-12 percent. During July-January they totaled 339 million pounds (export weight) down 11 percent. United Kingdom manufacturers have taken substantially less.

Flue-cured tobacco disappearance in the current marketing year may fall 7 percent below the previous year's 1.2 billion pounds. This would leave carryover in mid-1970 around 2.0 billion pounds, up 3 percent.

Flue-cured growers intend to set about 8 percent less acres than last year. Although the base quota is

unchanged, the effective quota is about 10 percent below 1970 because of a smaller carryover of undermarketings. With average yields, production could turn out 15 percent below last year's 1.19 billion pounds. Even with larger beginning stocks, next season's supply would total less than in 1970/71.

Disappearance of burley tobacco in 1970/71 may decline from last year's 565 million pounds. Domestic use may decline a little even if U.S. cigarette output steadies. Large foreign burley production has diminished our exports. Burley carryover next October 1 probably will not change much from the year-earlier level.

Congress postponed the burley program announcement and is considering new legislation that would

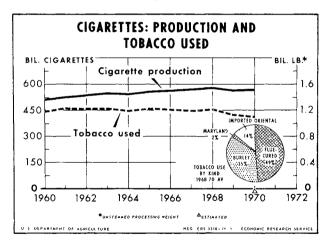

authorize a poundage control program in place of acreage allotments. If enacted and then offered to growers, a two-thirds favorable vote would be required to continue marketing quotas and price support. If a program is not so approved, neither quotas nor price supports would apply on the 1971 crop. The March 1 grower intentions project to a crop 4 percent below last year, but the program offered to producers may change their plans. A reduced crop would result in a 1971/72 supply fractionally smaller than this season.

Slight increases in acreage are in prospect for fire-cured, Maryland, and eigar binder types. Decreases are indicated for dark air-cured, eigar filler, and shade-grown eigar wrapper.

TOBACCO PRODUCTS

Cigarette Production Record High in 1970

U.S. cigarette output gained last year. Both domestic consumption and exports rose to new highs following a setback in 1969. Also, manufacturers added to inventories. For this year, with cigarette advertising at a lower level, use may about hold steady. Manufacturers probably will reduce their inventories, so cigarette production may decline slightly.

Cigarette output last year totaled 583 billion, 4 percent above the 1969 level, and 2 percent above the previous high in 1968 (table 1). Last year's increase was the biggest change since 1958. Most of last year's gain occurred in the second half when manufacturers brought out new brands and built inventories as a strike hedge for 1971. Anti-cigarette publicity continued at a high level last year, but apparently did not dampen consumption to the same extent as in 1968 and 1969.

U.S. smokers (including those overseas) used 2 percent more cigarettes than in 1969. Consumption per capita, 18 and over, held its own at 4,000 (200 packs of 20). That was still below the 1963 peak (table 3).

U.S. exports of cigarettes soared one-sixth above 1969 and one-tenth above the previous record of 1968. The declared value of cigarette exports rose to \$159

million, up 23 percent reflecting a gain in unit value as well as quantity. Booming foreign cigarette consumption means U.S. exports will likely continue their upward trend this year.

Cigarette exports to leading destinations, 1969-1970

Filter Trend Continues

The annual ERS survey of cigarette manufacturers indicated a further gain in filtertip cigarettes in 1970 to 80 percent of production—up from 78 percent in 1969—and a consequent decline in the non-filter category (table 2). The filter-tip gain was largely in the 100 millimeter size, that made up 10 percent of 1970 output.

Except for the 100 millimeters, filter-tip cigarettes have a shorter tobacco column than nonfilter cigarettes. Over the past several years the filters have been lenghtened. Also, some brands have smaller diameters. These factors substantially reduce tobacco requirements per cigarette.

Cigarette Price Rise Slows

Retail cigarette prices rose in 1970, mostly due to manufacturers' wholesale price increases and higher

cigarette taxes by many States. Since the price boosts in mid-1970, the rise has moderated, but in January the BLS retail price indexes for cigarettes were 6 percent above a year earlier.

The average State cigarette tax rate (weighted by number of packs taxed) was 10.7 cents per pack in December 1970, up from 10.1 cents a year earlier. Tax increases are proposed this year in several States. The Federal excise tax is 8 cents a pack. In addition, a considerable number of local governments tax cigarettes.

Cigarette Manufacturers Report Tar and Nicotine

After the FTC proposed a trade regulation rule last August, cigarette manufacturers voluntarily agreed to report cigarette tar and nicotine content in their advertising. FTC accepted the manufacturers' plan on December 22. Advertisements with the most recent FTC text results began appearing in February.

FTC and HEW Report to Congress

In January, the Federal Trade Commission and the Department of Health, Education, and Welfare submitted annual reports and recommendations to Congress as required by the Public Health Smoking Act of 1969.

The 1971 HEW report summarizes the entire field of medical literature concerning the health consequences of smoking. An HEW survey of cigarette smoking habits last spring indicated for the first time the smoking rate for women dropped. The proportion of men who smoke continued to decline.

The FTC reiterated its 1969 recommendations that a warning label and a statement of the tar and nicotine content of cigarette smoke be required in all cigarette advertising and on packages. FTC recommended increased HEW spending for public education on health hazards of smoking, and for National Institutes of Health research to develop less harzardous cigarettes.

Cigar Consumption Gained in 1970

The gain in cigar consumption continued in fourth quarter 1970, so for all of last year U.S. smokers (including those overseas) consumed about 8.1 billion cigars—1.7 percent more than in 1969. This gain compared with a 0.2 percent gain in 1969 and decline for 4 years previously (table 5). The BLS index of retail cigar prices rose 1 percent last year. Cigar consumption may rise again this year.

Lower priced cigars accounted for the gain in taxable removals. Manufacturers devoted more promotion effort to smaller cigarillo-size cigars.

Roll-your-owns Boost Smoking Tobacco Use

Despite a lower rate in the fourth quarter, U.S. production of smoking tobacco last year totaled 69 million pounds, 9 percent above 1969. All the increase came from rising sales of brands for roll-your-own cigarettes; pipe tobacco volume was unchanged (tables 7 and 8).

Last year's estimated consumption of smoking tobacco—domestic sales plus imports—amounted to 74 million pounds, 8 percent above 1969. Domestic factories sold 5 percent more in 1970. Gains may continue this year but at a slower rate.

Roll-your-own took an estimated 28 million pounds of smoking tobacco in 1970, about 38 percent of U.S. smoking tobacco consumption (table 9).

Cigars: Taxable removals by revenue class, 1969-70

| Revenue class and retail price | 1969 | 1970 | Change from 1969 |
|----------------------------------------------------------------|---------------------|---------------------|------------------------|
| | Billion | Billion | Percent |
| A-D (up to 8 cents) E (over 8 to 15 cents) F-G (over 15 cents) | 4.91 2.40 .54 | 5.23 2.22 .53 | +6.5 -7.5 +1.9 |
| Total removals | 7.84 | 7.98 | +1.7 |

Manufactured tobacco imports (mostly smoking tobacco) reached a new high of 8.4 million pounds in 1970. The value was \$10.9 million. Most imports came from the Netherlands, with Sweden, United Kingdom and Denmark secondary sources.

Bulk Smoking Tobacco Exports Gain

Exports of smoking tobacco in bulk, after declining in 1969, rose 13 percent to 23.7 million pounds in 1970. The average value also gained, bringing total value to \$27.9 million. This export category includes specially prepared cigarette leaf and cut or shredded tobacco from U.S. and foreign sources. It also includes processed sheet, blended strips, or stemmed tobacco consisting of more than one kind—principally blended flue-cured and burley.

Bulk smoking tobacco exports to leading destinations, 1970

| Country | Amount | Country | Amount |
|---------|-------------------|-----------------|----------------------|
| | Mil. lb. | | Mil. lb. |
| Italy | 3.7 3.0 1.8 | Bolivia Ecuador | .8 .8 .6 .6 |

Chewing Tobacco Output Below 1969 High

Lower production and sales in the final quarter of 1970 reduced last year's output of chewing tobacco to 69 million pounds, 1.4 percent below 1969. Of the 2 principal catergories, scrap output stayed about the same while plug chewing declined 6 percent (table 10).

Manufacturers sell virtually all their chewing tobacco output domestically. Sales last year fell 1.6 percent with nearly all of the decline in plug. Wholesale prices rose 11 percent for the year.

Snuff production in 1970 dropped 4 percent as domestic sales were off 1 percent. Snuff use has trended downward since 1956.

Tobacco Products Expenditures and Taxes

Consumers and businesses spent an estimated \$11.7 billion for tobacco products during 1970, one-eighth more than the previous year. Expenditures on cigarettes continued to gain and accounted for 90.6 percent of the total (table 25).

Federal, State, and municipal taxes on tobacco products totaled an estimated \$4.7 billion, or 40 percent of the tobacco expenditures. During the 1960's Federal tobacco taxes were \$2.0-2.2 billion a year, and they far surpassed State taxes. But States increased their rates and their tax take now exceeds the Federal collection. The annual gain in tax revenues from tobacco products during the 1960's averaged 4 percent (table 26). Tobacco taxes account for about 1 percent of the Federal Government receipts and about 2 percent for State and local governments.

U.S. EXPORTS AND IMPORTS

The United States is the leading tobacco exporter and the third largest tobacco importer. In recent years about 35 percent of the U.S. tobacco crop has been exported—representing about one-third of world tobacco exports. U.S. exports of tobacco and products were valued at a record \$679 million in 1970. This includes unmanufactured tobacco worth \$488 million and tobacco products of \$191 million. Imports used for blending with domestic types and tobacco products were worth \$127 million. Thus, U.S. foreign trade in tobacco contributed a substantial favorable trade balance.

Leaf Tobacco Exports Decline

With exports trailing year-earlier volume for all but 2 months last year, U.S. exports of unmanufactured

tobacco in 1970 totaled 510 million pounds (export weight). This was 570 million pounds farm-sales weight. Compared with 1969, last year's exports were off 12 percent. Heavy movement in late 1969 held down first quarter shipments; second quarter recovery reflected some program shipments. Third and fourth quarter shipments were hurt particularly by U.K. manufacturers buying less of the 1970 flue-cured crop.

Reduced exports of flue-cured—the principal export class—accounted for most of the drop in U.S. exports. However, burley and cigar kinds were also lower. Exports of Maryland, Black Fat, and stems and trimmings were higher. Fire-cured and dark air-cured exports held about the same as in 1969 (table 11).

Malaysia and Singapore.

Detail may not add to total due to rounding.

Last year 123 million pounds of tobacco were bartered for materials and services used by U.S. agencies overseas. These transactions are considered equivalent to dollar sales. About six-tenths of barter exports went to Western Europe, three-tenths went to the Far East and Pacific countries, and the remainder to other areas. CCC provided credit on 59 million pounds of commercial exports. Most financing is for 12 months but is authorized up to 36 months. This program reduces storage charges and permits U.S. exporters to meet credit terms offered by other countries (table 12).

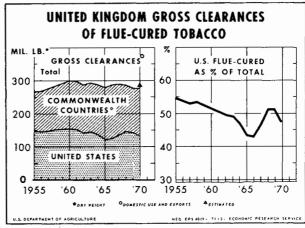

The July 1970-January 1971 exports of 339 million pounds were 42 million below a year earlier. Little pickup is in sight and exports for the rest of the fiscal year will do well to equal the year-earlier level. For the year ending June 30, 1971, U.S. exports of unmanufactured tobacco may fall 10-12 percent below the 571 million pounds shipped in 1969/70.

Other Export Highlights

The United Kingdom, the largest export market for U.S. leaf, reduced takings 29 percent from 1969. Manufacturers depleted their stocks because of lower cost supplies from eleswhere. Also, there was entry into the European uncertainty over U.K. Community (EC), and possible adverse consumer reaction to a health report which was issued in January. Germany-the second ranking U.S. market-decreased takings 9 percent from the previous year's high level. The EC adopted a restrictive Common Agricultural Policy (CAP) for raw tobacco last year. Japan-the third ranking market-had a big gain in takings after 1969's decline. Shifts in shipping patterns account for some of the variations. Among other major markets, the Netherlands, Belgium, Italy, and Australia reduced takings from the United States sharply when competitive supplies became available from other countries.

Flue-cured exports made up seven-tenths of the total. These exports declined 15 percent from 1969 with a

smaller quantity going to the United Kingdom and most European countries, including West Germany. Sizable increases were recorded by Japan.

Burley exports were down sharply to the European Common Market countries and Switzerland. Maryland tobacco exports gained 1 million pounds but stayed 2 million below 1968 level. Takings increased for Switzerland, the major market, where U.S. flue and burley use is gaining. Belgium and Portugal took less.

U.S. tobacco exports under Government financed programs (Public Law 480) in 1970 totaled about 22 million pounds, the smallest quantity since the program began in 1954. Most of the exports for foreign currencies last year went to South Vietnam. The Philippine Republic took the largest quantity of long-term dollar credit shipments.

U.S. Tobacco Imports Pick Up

Imports of unmanufactured tobacco for consumption (factory use of imports) recovered in 1970 following a decline 1969. The total of 219 million pounds was up 4 percent (table 13).

Despite last year's higher U.S. cigarette production, manufacturers used less oriental cigarette leaf. There were gains in imported flue-cured and burley leaf and in lower valued imports of scrap (small pieces of leaves used principally for cigars).

Cigarette tobacco imports picked up at the end of 1970 to account for about one-seventh of domestic tobacco utilization. A high level of factory use will probably continue this year.

^{1/} Preliminary.
2/ Canada, Greece, Cyprus, Lebanon, India, Korea.
3/ Less than 50,000 pounds. Detail may not add to total due to rounding.

Compiled from publications and records of the Bureau of the Census.

During 1970, imports of cigarette leaf (for consumption) increased 2 million pounds. There were lower imports from the 2 major suppliers—Turkey and Greece. The leaf total includes a 3 million pound gain for flue-cured and burley. Average value of U.S. imports of oriental leaf about held its own.

The 1970 imports of scrap for consumption increased 7 million pounds. Turkey, Greece and Dominican Republic had gains. Scrap from Turkey and Greece is considered suitable for cigarette use. There were decreased imports from the Philippine Republic and Colombia.

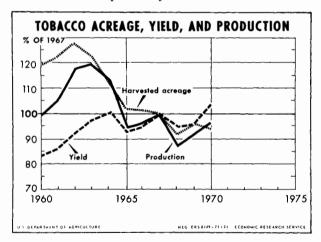

General imports of tobacco (arrivals; i.e., direct entries plus that placed in bonded warehouses to be withdrawn for factory use later) dropped further. Oriental cigarette leaf declined the most. Flue and burley leaf and unstemmed cigar filler gained sharply. Most of the filler is reworked in bond and imported as scrap for factory use.

As a result of lower imports, stocks of imported cigarette and smoking tobacco in the United States on January 1, 1971, were down 6 percent from a year earlier (farm-sales weight). Foreign grown flue-cured and burley tobacco are included in the total, but are now reported separately. U.S. stocks of imported cigar leaf increased a little. These inventories include stocks in bonded warehouses, in warehouses of manufacturers and dealers, and in transit.

TOBACCO LEAF SITUATION AND OUTLOOK

Because of smaller carryovers, the supply of domestic leaf tobacco in 1970/71, at 5.57 billion pounds, was 1 percent below the previous year. As the larger 1970 crop moved off the farms and the export pace slowed, nonfarm leaf stocks on January 1 climbed 2 percent over a year earlier.

Despite lagging export trade, brisk cigarette sales should keep carryover stocks at the end of the current marketing year about the same as the 3.7 billion pounds at the start. Last year, U.S. cigarette manufacturers used an estimated 1,142 million pounds of tobacco (unstemmed processing weight). This quantity was about the same as in the previous year.

Prospective Acreage Down

Following a year of increased flue-cured production and record-high burley yields, tobacco growers plan to set 6 percent less acreage, according to the March intentions report. An 8 percent decline in flue-cured accounts for most of the drop. Burley growers intend 5 percent less acreage; however, this year's program has not been announced. Growers of Maryland, fire-cured, and cigar binder may set more acreage. Dark air-cured,

cigar filler, and cigar wrapper may drop. Although the base quota for flue-cured is unchanged, allowance for 1970's net undermarketings give an effective poundage quota 10 percent less than last year.

All tobacco types except Maryland, Pennsylvania filler, shade-grown cigar wrapper, and perique are under quotas this year. Basic allotments were increased for Virginia fire-cured. Quotas were increased and then terminated for cigar binder (types 51-52). Allotments for Kentucky-Tennessee fire-cured and dark air-cured, Virginia sun-cured, and cigar filler and binder (types 42-44 and 53-55) did not change.

Congress is considering new legislation for burley to authorize poundage controls instead of acreage allotments. Any burley program must receive a two-thirds favorable vote in a referendum so price supports and marketing quotas can continue.

For all types of U.S. and Puerto Rican tobacco, production from this year's intended acreage would total

^{1/} Quotas based on acreage allotments unless otherwise specified. 2/ A majority of two-thirds or more of farmers voting is required for marketing quotas to become effective under the acreage allotment program or acreage-poundage program. 3/ Probable month, but referendums can occur earlier if warranted by pertinent considerations. 4/ Unless at least a fourth of the growers petition the Secretary in the interim.

1.71 billion pounds, 10-1/2 percent less than last year. This level can be achieved with a reasonably favorable season. This size crop plus the tentative carryover gives a 1971/72 supply a little under this year's level. However, the burley program that eventually develops could change the prospective crop.

1971 Price Support Program

Growers of Virginia sun-cured tobacco approved marketing quotas on their next 3 crops in a referendum held in February. Therefore, government price support will be available for their 1971, 1972 and 1973 crops. Burley price support depends on producers approving marketing quotas in a referendum. Growers of Maryland and Pennsylvania filler tobaccos disapproved marketing quotas in referendums conducted in February.

FLUE-CURED

Utilization Drops Despite Cigarette Surge

Domestic disappearance of flue-cured tobacco (types 11-14) during 1970/71 may fall 3-4 percent below last season's 665 million pounds. During the first half of this marketing year, domestic disappearance ran 6 percent less, despite the surge in cigarette production. Cigarette output for last July through January was 7-1/2 percent higher than in the comparable period of 1969/70. Manufacturers are evidently continuing to reduce the tobacco content of cigarettes.

Exports so far this marketing year, are substantially below the year-earlier period, lowering the season's flue-cured prospects a tenth. July-January exports reached 334 million pounds, 10 percent below those in the same period of 1969/70. Lowered shipments to the United Kingdom accounted for most of the decline. Heavier competition from other suppliers prevented any U.S. gains in several other European countries. Japan's big gain provided a bright spot in the export picture. West Germany's takings were up from the low level a year ago.

Carryover Rising

Based on prospects for lower domestic use and exports, the carryover of flue-cured tobacco on July 1, 1971, will rise 50-60 million pounds above the 1.95 billion of mid-1970. In contrast, the carryover fell by 147 million pounds in 1969/70. This season's increase will occur largely in CCC loan stocks (table 15).

In the 7 months ended February 28, 1971, there were 48 million pounds sold from government loan stocks, compared with 76 million for the same period last year. Unsold loan stocks on hand March 1, 1971, were above a year earlier.

1971 Acreage Declines

The national base quota is the same as 1970, but decreased poundage allocations (reflecting the smaller

| Total* | 266 | 286 | 255 |

^{*}Based on unrounded data.

carry forward of last year's net undermarketings) means a smaller crop. Undermarketings in 1970 exceeded overmarketings by 12.5 million pounds. Growers can make up 6 million pounds of their undermarketings, but sales from the 1971 crop will still fall substantially short of 1970's level. Last season, growers could make up 131 million pounds of undermarketings from 1969.

According to March 1 intentions, 538,700 acres will be grown, 8 percent below last year. Type 12 growers (Eastern North Carolina) account for one-half of the cutback. On the intended acreage, an average yield per acre—which takes into account a modified trend due to the restraints of farm poundage quotas—indicates a 1971 production of about 1 billion pounds. A crop this size would be about 15 percent below 1970, when yields were the second highest on record.

The projected crop plus the tentative carryover gives a 1971/72 supply about 3 percent under the 3.13 billion pounds available in the current marketing year.

BURLEY

Poundage Program Considered

The Senate Agriculture and Forestry Committee has voted to report a bill authorizing a poundage program for burley tobacco. If enacted, and then if favored by at least two-thirds of burley growers voting in referendum, the estimated 1971 marketing quota would be below last year's marketings. The proposed poundage program would abolish minimum acreage provisions and for the first time allow growers to lease and transfer quotas within counties. If growers disapprove the control program then allotments and price supports are not in effect for 1971, and USDA will hold another vote in 1972.

Last December, USDA indicated the present marketing quota law required USDA to cut burley acreage allotments not protected by minimum provisions

^{1/} C4K grade.

at least 25 percent. Minimum acreage provisions had been in effect since World War II. By 1970 about 60 percent of the allotments were at the statutory minimum of one-half acre or less. With controls on acreage, growers increased yields to offset acreage reductions. Burley yields trended upward, last year averaging the highest in history. The law required USDA to announce the burley quota by February 1, but Congress twice postponed the 1971 announcement while the new legislation was considered.

The current prospective plantings, if realized with an average yield adjusted for trend, means production would total 3 percent less. The indicated carryover would result in a 1971/72 supply fractionally below the 1.9 billion pounds of the current marketing year.

If growers approve marketing quotas, the price support level will be 71.5 cents a pound—2.9 cents above the average for the 1970 crop.

Supplies Remain Large

The 1970/71 burley tobacco supply is about 1.9 billion pounds, fractionally below last year but still equal to 3.4 times estimated disappearance. The October 1 carryover was up, although last year's crop was smaller (table 16).

By February 28, government loan stocks of burley increased by about 13 million pounds above the 487 million of a year earlier. The current marketing year is the fifth year of rising loan stocks.

Carryover May Change Little

Domestic burley use in 1970/71 may equal the 507 million pounds of last marketing year if cigarette production stays about the same.

Following record burley exports in 1969/70, shipments in the first 4 months of the current marketing year (October 1970-January 1971) fell 5 million pounds. This was due to a sizable decrease in takings by Italy, where local production has increased sharply in recent years. Switzerland also reduced its takings sharply but West Germany took more.

Overall, foreign burley production in 1970 gained 54 million pounds from the previous season's record.

If the downtrend in burley disappearance continues the U.S. carryover probably will not change much from the 1,343 million pounds of last October 1. But loan stocks will make up an increasing share.

Average Price Higher

The 1970 burley crop brought the second highest average price on record but sales volume dropped below 1969. Grade price averages were higher, but the general quality declined. Total sales value was the fourth largest on record. Trade purchases rebounded, so government loan placements decreased to the lowest level in 5 years.

Auction prices for the 1970 burley crop (including resales) averaged 72.1 cents a pound-more than 2.6

cents above the previous year's level. Average change by States ranged from a 2 cent decline to a $4\frac{1}{2}$ cent gain (table 17).

Markets opened November 23, and the season ended February 17 at Lexington, Ky. Sales took 9 fewer days than for the 1969 crop although gross auction sales dropped 6 percent. About 85 percent of the estimated crop was sold by December 17, when markets closed for the holidays.

For most grades, prices were up 2 to 5 cents a pound. Smaller changes occurred in top quality grades. As a result, price spreads between major cigarette grades and medium-and-heavy-bodied grades again widened as they have for several years (table 18).

MARYLAND

Auctions Open April 13

Auctions for the 1970 crop of Maryland tobacco (type 32) open April 13 and continue through June 25. Sales will also be held by the hogshead market. Maryland tobacco does not receive government price support.

The 1969 crop (marketed mostly in 1970) brought the highest average price on record, 75.1 cents a pound. This was 8 percent above the preceding season, as marketings dropped.

1970/71 Supplies at 22-year Low

Last year's disappearance brought the January 1 stocks down 17 million pounds. Growers produced an estimated 27 million pounds last year, so this year's supply is 19 percent below 1969/70 and the lowest since 1948/49 (table 19). Use may decline from the past marketing year's high level due to record-high prices and reduced supplies.

During the first third of the current marketing year (October 1970-January 1971) exports were 3.3 million pounds—0.7 million less than a year earlier. Switzerland remains the principal outlet but took less than in the same 1969/70 period. Swiss cigarette manufacturers are selling more American-type blends while the share held by the Maryland blend is declining.

More Output in Prospect

Based on farmers March 1 intentions, they will raise about 28,000 acres this year—8 percent more than in 1970. As in the past 5 years, acreage allotments are not in effect.

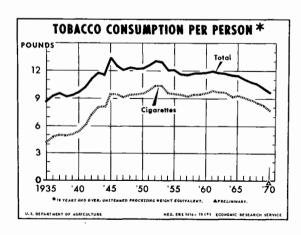

Assuming an average yield, about 29 million pounds would be produced from the 1971 intended acreage—about 7½ percent above the estimated 1970 outturn. Carryover next January 1 will likely fall below this year's 50 million pounds. So the 1971/72 supply—projected output plus tentative carryover—may total below this year's 77 million pounds.

^{1/} Subject to revision.

^{2/} Year beginning October 1.

FIRE-CURED

Record-High Prices

The Kentucky-Tennessee crop (types 22-23) sold for record-high prices but sales volume declined. The quality of offerings improved a little over 1969 for type 22 but was lower for type 23. Lower quality and slightly lower prices after substantial gains for the previous 2 years marked sales for the 1970 Virginia fire-cured crop (type 21). Auction sales began in early December for Virginia fire-cured and in mid-January for types 22-23. Final sales were held in February.

Most grade averages were lower for type 21, but higher for types 22-23. Deliveries to associations under the government loan program were the lowest on record. The average price of 54 cents per pound paid for the 1970 crop (types 21-23) was up 10 percent from the previous year. Volume of producer marketings dropped $9\frac{1}{2}$ percent.

Due to smaller carryover and lower production, marketing year supplies of fire-cured types are down about 8 percent.

Fire-cured and dark air-cured tobacco Ioan stocks, 1969-71 (Farm-sales weight)

| Туре | | End of Februar | у | | |
|-------------------------|------|----------------|------|--|--|
| | 1969 | 1970 | 1971 | | |
| | | Million pounds | 3 | | |
| Virginia type 21 | 2.9 | 1.6 | 1.4 | | |
| types 22-23 | 21.8 | 12.5 | 10.1 | | |
| KyTenn., types 35-36 | 16.2 | 16.2 19.5 | | | |

Exports Turn Down

During the first third of the current marketing year (October 1970-January 1971) exports of Kentucky-Tennessee fire-cured dropped to 8.3 million pounds from the year-earlier level of 9.6 million. The decrease was in shipments to the Netherlands, the major destination. Switzerland also decreased its takings. Exports of Virginia fire-cured gained with a sizable shipment to Syria.

World fire-cured production gained about 9 percent last year as Malawi's production recovered. So U.S. exports may not gain this marketing year. Here in the United States, with snuff and plug chewing output trending down, domestic use of fire-cured types in 1970/71 will do well to hold at last season's level (table 20).

Prospective Acreage Up

Acreage of fire-cured types in 1971 will gain 4 percent according to farmers' intentions as of March 1,

with a 2 percent gain for type 21 and a 5 percent gain for types 22-23.

Acreage allotments for most farms growing Virginia fire-cured (type 21) were increased 10 percent. Kentucky-Tennessee allotments were held the same. The 1971 fire-cured crop will receive government price support averaging 48.5 cents a pound—1.9 cents above last year.

If the yield per acre is average (with allowance for trend) production of the combined fire-cured types would total around 42 million pounds—some 14 percent above 1970 crop marketings.

Carryover of fire-cured on October 1, 1971, may be around 65 million pounds—12 million less than last October 1. Such stocks, plus the projected crop, would provide a supply some 5-6 percent below the 110 million pounds for the current year.

DARK AIR-CURED

Auction Prices Recover

Better quality and higher prices prevailed for sales of the 1970 crop of dark air-cured tobacco (types 35-37). Volume was down for each type. Auction sales started in early December and closed in February.

Most grade averages were higher and government loan placement fell sharply. Compared with lower levels the previous season, the price average gained 7 cents per pound for type 35, which had the largest decrease in sales volume. The increase was 3.5 cents for type 36 and 0.8 cent for type 37.

The 1970/71 supply of dark air-cured, at 73½ million pounds, is down about one-tenth. Supplies of both types 35-36 and Virginia sun-cured are lower (table 21).

Domestic Use Lower, Exports Gain

Plug, twist, and fine-cut chewing tobaccos are the chief domestic outlets for dark air-cured tobacco. Output of these products has trended down, and the decline continued in October-December 1970 (first quarter of the current marketing year).

In October 1970-January 1971, exports of One Sucker leaf were 63,000 pounds below a year earlier. Tunisia did not take any in contrast to sizable receipts in the corresponding period a year ago. Exports of Green River declined. A large part of U.S. exports of dark air-cured tobacco is in the form of Black Fat—a semiprocessed product. The rebound of these exports to African destinations continues. In October 1970-January 1971, Black Fat exports were 143,000 pounds above the year-earlier level.

Intended Acreage Down

Farmers this year plan to harvest 4 percent less acreage of dark air-cured (including sun-cured). For most farms growing these types, acreage allotments are the same as in 1970. Based on an average yield per acre, with

^{*} Indicated by sales data. ** Estimated.

allowance for trend, 1971 production of dark air-cured and sun-cured would be nearly 17 million pounds—about the same as marketings from the 1970 crop.

Because utilization may exceed last season's marketings, the carryover of dark air- and sun-cured types next October 1 probably will decline from the 57 million pounds last October 1. The indicated carryover plus this year's projected crop would result in a smaller supply.

CIGAR TOBACCO

Prices and Price Support

Buyers paid less for the 1970 filler crop, but more for binder types. A sizable proportion of the Connecticut binder crop again went under loan. Season average price and production data for the 1970 cigar tobacco crops are scheduled for release May 10.

The overall price support levels for the 1971 crops of cigar leaf tobacco are about 4.2 percent higher than for the 1970 crops. (Statistical Summary).

For many years, the Puerto Rican Government has allocated annual poundage quotas to cigar filler growers and made supplemental payments. The current supplemental rate is expected to be 16 cents per pound. Government price support is not in effect for Pennsylvania tobacco (type 41) and shade-grown cigar wrapper (types 61-62).

Cigar Filler and Binder Allotments

For most farms growing cigar filler and binder tobacco (types 42-44, 53-55) USDA set 1971 acreage allotments about the same as in 1970. Because some farms went out of production, the national acreage allotment is 3 percent smaller than in 1970. Also, USDA reallocated allotments from growers who did not wish to use their allocated acreage this year to growers who want to increase their crop.

In January, USDA raised allotments for most farms growing cigar binder (types 51-52) 10 percent above 1970. These Connecticut-Massachusetts supplies continue substantially below normal and again this year USDA terminated quotas for types 51-52.

U.S. and Puerto Rican Supplies Lower

Supplies of U.S. and Puerto Rican cigar tobacco are down 8 percent from the past marketing year. Production was lower but most of the decline occurred in carryover. Cigar filler and binder largely accounted for the drop (table 22).

March 1 grower intentions indicate smaller acreages of cigar tobacco this season. Based on average yield, the crop may be down 4 percent.

The prospective acreage decline is among cigar filler and wrapper types. Filler has experienced the weakest market in recent years. With soaring prices, Wisconsin tobacco growers have made a comeback in acreage. After 2 years of sharp reductions, manufacturers apparently needed to further reduce cigar wrapper acreage.

The January 1, 1971, stocks of Puerto Rican tobacco (on the Island and in the United States) totaled 19 million pounds—5 million below a year earlier and only four-tenths of the high level 4 years earlier. The crop, planted in late 1970 for harvest in early 1971, is

tentatively estimated at 5½ million pounds—further below last year's record-low harvest.

Less foreign cigar tobaccos arrived in the United States in 1970 than the year before. The average import value of cigar filler and scrap tobacco brought in last year was 29 cents per pound.

Domestic Use Estimate Steady

Cigar makers may sell more cigars this year than last. But due to dwindling supplies, domestic disappearance of U.S. filler types will probably fall from last marketing year's low level. Imported tobacco is a growing source of cigar filler, accounting for about six-tenths of our total filler use.

During October 1970-January 1971, cigar factories used more imported cigar tobacco (imports for consumption) than a year earlier. Of the chief sources, imports from the Dominican Republic, the Philippines, Colombia, and Brazil were larger.

For Connecticut Valley cigar binder, disappearance in 1970/71 will probably not match last season's level due to short supplies. During the first 4 months this season, exports of Connecticut Valley cigar binder declined a little with smaller exports to West Germany, the chief destination.

With steady sales prospects for scrap chewing tobacco and shifts away from competing tobacco, domestic disappearance of Wisconsin tobacco may gain. Spain took no Wisconsin tobacco during October 1970-January 1971, in contrast to a sizable shipment a year earlier.

Domestic use of cigar wrapper is declining further. Stocks on January 1 were slightly above a year earlier. Annual disappearance may equal the 1970 crop of 13½ million pounds. Thus, the July 1 carryover could approximate the year-earlier level. Exports in July 1970-January 1971 were down one-seventh. The United Kingdom took more but the Canary Islands, Canada, and West Germany took less.

TOBACCO ACREAGE AND YIELDS--TRENDS AND PROSPECTS

by

Johnny D. Braden, Agricultural Economist Economic and Statistical Analysis Division Economic Research Service

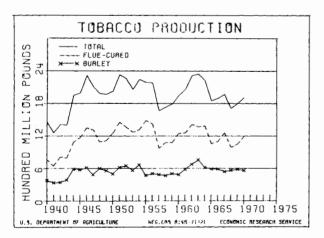

ABSTRACT: Tobacco production has fluctuated widely over the past 3 decades. Acreage harvested trended downward since 1946 and was largely determined by acreage allotments. Tobacco yields increased at an accelerated rate until acreage-poundage quotas were adopted for flue-cured in 1965. Technology and marketing quotas have affected yields. A decline in tobacco production is in prospect. Emphasis is expected to shift from yield-increasing to laborsaving technology.

KEY WORDS: Tobacco, production, acreage, yields, technology, acreage allotments.

Tobacco is being producted on fewer acres than formerly, as is true for many crops. Six classes of tobacco are produced in the United States, but two kinds—flue-cured and burley—account for about 90 percent of production.

PRODUCTION TRENDS

Over the past 3 decades tobacco production fluctuated widely, showing little or no particular trend. Several peaks and troughs occurred with production ranging between a low of 1.26 billion pounds in 1941 and a high of 2.34 billion in 1963. Both flue-cured and burley followed this general production pattern, but fluctuations were more pronounced for flue-cured.

Changes in both acreage and yields are instrumental in causing production variations. A regression analysis in logarithms of annual changes measures the relative influence of acreage and yields on production. The analysis indicated for 1940-69 that acreage changes exerted more influence than yield changes, but acreage has become less influential since the early 1960's.

Relative effect of changes in acreage and yield on annual changes in tobacco production, 1940-69

From 1940 to 1963 acreage changes were associated with 60 percent of output changes and yields 40 percent. Since 1963 the relative influence has shifted to about 50 percent for yields and 50 percent for acreage. For both flue-cured and burley tobaccos the influence of acreage change has declined, suggesting that acreage allotments have less influence on production than formerly.

ACRES HARVESTED

Tobacco acreage has trended downward since the mid-1940's. Acreage increased 15 percent from a trough in 1941 to a peak of almost 2 million acres in 1946. Since then it has declined an average of 28,000 acres per year. Variations around this trend were minor except for a peak in the early 1950's and one in the early 1960's. The record high was 2.1 million acres in 1930 when yields averaged less than 800 pounds per acre. Since then yields have nearly tripled.

¹ For Methodolgy used see, Sackrin, S.M., "Measuring the Relative Influence of Acreage and Yield on Crop Production". *Agr. Econ. Res.* Vol. IX No. 4, pp. 136-39, Oct. 1957, USDA.

Major factors affecting acreage harvested are the national acreage allotments and marketing quotas. Other factors are prices received by growers and competition for labor from nonfarm employment. For 1970 USDA set allotments for 8 kinds of tobacco accounting for 94 percent of total harvested acreage. So total harvested acreage follows very closely the pattern set by allotted acreage. In all but 2 years since 1940, acreage allotted was 95 percent or more of total acreage harvested. In 12 of the last 17 years allotted acreage about equaled or exceeded harvested acreage.

For a given type of tobacco, plantings are usually a fairly constant percentage of allotted acres unless the basic program changes-such as allotment shifts or land retirement. Due to particular circumstances, some growers underplant their allotments. The law requires allotments that were less than 75 percent produced in recent years be reduced in line with plantings.

Allotments can be share-cropped, but beyond this the flexibility varies. Some allotments cannot be transferred without selling or leasing the farmland. For certain types of tobacco, allotments can be leased and transferred, or sold within counties. However, owners sometimes have difficulty finding renters especially on small acreages.

Prices that farmers receive for their products usually influence their production decisions. Returns per acre for tobacco are relatively high compared to alternative crops; therefore changes in tobacco prices probably have had less influence on farmers' decisions than is true for most other crops. Most tobacco is eligible for price support and this sets a floor for grower prices. Both the support level and the average price received for most tobaccos have been considerably above the direct production cost. Thus for most tobacco, prices have not been a critical factor in deciding how much acreage to produce.

Labor shortages at prices farmers are willing to pay limit tobacco acreage in some producing areas. This is particularly true for fire-cured, dark air-cured, and cigar filler and binder tobaccos that sell for considerably less than flue-cured and burley. Also, Maryland tobacco is produced in a high wage area and its acreage has been trending down.

The average farm wage rate more than doubled over the last 2 decades from 69 cents per hour in 1950 to \$1.64 in 1970. The wage rate is slightly lower in the major tobacco producing States, but the percentage increase is greater. In addition to farm wage increases, competition for labor from higher paying nonfarm industries also increased.2

YIELDS

The average tobacco yield increased from around 1,000 pounds per acre in the early 1940's to more than 2,100 pounds in 1970. At first the increase was gradual-through 1953 it averaged about 29 pounds per year. The rate then accelerated to an average of 66 pounds per year until 1964. After 1964 the average yield

leveled off, reflecting the downturn in flue-cured yields following the adoption of acreage-poundage marketing quotas. Flue-cured and burley yields prior to 1964 followed about the same general pattern. Since 1964 burley yields increased but flue-cured yields declined.

Technology

Tobacco yields over the past 3 decades were influenced by many economic and institutional factors. Major factors have been new technology and improved practices growers applied to boost yields. Technological change can conveniently be broken into 3 stages—(1) invention, (2) innovation, and (3) rate of adoption.³ The relatively smooth and increasing yield trend suggests that the producer's adoption process has been gradual but at an accelerated rate.

Compared to most crops, growers produce tobacco with a low capital investment, but large amounts of relatively unskilled labor are required. Traditionally, little machinery and equipment are involved. Until recently, growers could adopt new technology with little additional capital or change in the basic production routine. The changes generally increased yields and reduced labor requirements.

The most widespread changes have been in fertilizers, pesticide and growth chemicals, and tobacco varieties rather than mechanization. Mechanical harvesters and new type curing barns are now in the invention and innovation stages, but they require a considerable capital outlay. Because of the high cost compared to the small size of most allotments, producer adoption has been almost nil.

Fertilizer is applied in relatively large quantities per acre to boost yields. Producers fertilize virtually all tobacco and increased fertilization probably has accounted for much of the yield uptrend. Fertilizer nutrients used per acre (N-P-K) increased 55 percent from 1954 to 1964. The rate of N (nitrogen) applied per acre increased 64 percent during the 1954-64 period. P (phosphorus) increased 23 percent and K (potassium) increased 68 percent. Not only the application rate increased but the analysis shifted.

Chemical pesticides are used widely to obtain higher yields and reduce labor requirements. In 1966 about 81 percent of farms growing tobacco used chemical pesticides on about 91 percent of the tobacco acreage. The cost to farmers was about \$20 million. This was a decline of about one-third from 1964, due mainly to a 13 percent reduction in acreage grown and a 30 percent reduction in cost per acre treated.

Growers have used insecticides for many years, but with new and more effective chemicals, use increased

rapidly in the postwar period. In 1966 about 80 percent of tobacco acreage was chemically treated for insects at a cost of \$8.2 million. Nonchemical methods of insect control are mostly in the development stages.

Excluding plant beds, fungicides costing \$437,000 were used on 68,000 acres in 1966. Fungicides are less intensively used on tobacco than for fruits and vegetables.

Use of herbicides for weed control has not been widespread in tobacco production. Only about 19,000 acres were treated in 1966. Herbicides reduce labor, but improper use may inhibit tobacco yields. Plant bed sterilization by burning has been largely replaced by chemicals. They normally produce a healthier plant, reduce the labor requirements, and control weeds better.

¹Does not include seedbed and transplant pesticides. ²Does not include insectide-fungicides and other combinations. ³ N.A.=Not available.

Chemicals have been successful for sucker control, and to a lesser extent for topping. Topping and suckering were formerly done by hand; chemicals probably have been more effective in decreesing labor than increasing yields. In addition to topping and sucker control, these chemicals also cause the stalk to cure and ripen more evenly with less firing and waste from bottom leaves. Tobacco producers used \$8.4 million worth of growth regulators in 1966. This accounted for about 95 percent of this type chemical sold to farmers.

Tobacco varieties that are high-yielding have become numerous. Most are resistant to several of the major tobacco diseases, and adapted to particular growing areas. Also, some varieties can be harvested with less leaf damage and loss. However, some of the higher yielding varieties produce lower quality tobacco. With the numerous varieties available, a grower can select the one best suited to his particular farm operation.

'Irrigation is not widespread in tobacco production, but its use is increasing. In 1964, about 16 percent of

the tobacco acreage was irrigated. From 1959 to 1964 irrigated acreage about doubled. During years of low rainfall, irrigation increases yields and improves quality. Even in years when rainfall is high but poorly distributed through the growing season, yields are increased by applying water at critical stages.⁵

Acreage Allotments

Besides affecting acres harvested, acreage allotments have influenced tobacco yields. On a given allotment producers generally try to maximize yields. With fixed acreage and a small price differential for quality, individual farmers could maintain or increase their cash returns by increasing yields. As allotments decline growers apply more fertilizer per acre. Higher yielding and improved varieties are grown, and plant population per acre increased. Better disease and insect control, higher topping, and better sucker control have become common. Timing of each operation has received increasing attention.

Farmers have made considerable effort to offset acreage declines by increasing yields even if it meant producing a lower quality tobacco. Growers apparently have found that the value of increased poundage more than compensates for the increased production cost and any possible reduction in value per pound due to lower quality.

A number of changes affecting yields would probably have occurred without acreage controls, but acreage controls speeded up the process. This is illustrated by yield trends of allotted and nonallotted kinds of tobacco. Under acreage allotments from 1940 to 1964, flue-cured yields increased an average of 46 pounds per year. Under acreage-poundage marketing quotas since 1965, yields declined at an average rate of about 9 pounds per year. Maryland (type 32) tobacco yields increased about 21 pounds per year from 1960 to 1965, under acreage allotments. Allotments were not in effect after 1965, and yield has declined about 3 pounds per year since. Burley yields increased about 73 pounds per year since 1965.

For burley, acreage allotments were in effect since 1940 and yields increased at an average annual rate of 60 pounds per acre. Pennsylvania cigar filler has never had acreage restrictions and yields increased an average of 12 pounds per year since 1940.

As allotments became smaller, not only did growers try to maximize yields, they also concentrated production on their more productive land. Acreage allotment cuts resulted in less productive land being converted to other uses. This factor accounts for some of the yield increase, especially in areas where farms were small and the amount of desirable land limited.

⁵ Irrigating Tobacco, Farmers Bul. No. 2159, USDA; Field Irrigation of Tobacco, Circular 491, N.C. Agric. Ext. Ser., N.C. State Univ.

A regression analysis indicated that about 94 percent of the variation in the national yield between 1940 and 1969 was associated with time and average allotment size. The time variable allows for production practice shifts for which no annual data are available. Although the allotment size regression coefficient for burley did not have the expected sign, about 94 percent of burley yields and 90 percent of flue-cured can be associated with these variables.

PROSPECTS

If tobacco use continues its downtrend as expected, then the prospects over the next several years are for a decline in tobacco production. In proportion to disappearance, present supplies of flue-cured and burley are above desirable levels. So USDA is required to reduce allotments and bring the supply in line with requirements as measured by the legislative formula. Some production is lost as older growers retire. Also increasing labor shortages may mean more underplanted allotments.

Legislation is pending to change the burley program from acreage allotments to poundage marketing quotas. If burley shifts to poundage and fewer allotments are restricted by acreage controls, the push by farmers to maximize yields on a fixed acreage will likely dampen. The yield increase may slow or possibly disappear. Emphasis is expected to shift somewhat away from yield-increasing to laborsaving technology. Technological developments that produce better and more effective pesticides, fertilizers, and topping and sucker control will probably continue if they reduce unit cost. Some chemicals are banned from use on tobacco and there will likely be further restrictions on use of chemicals. This may spur the development of nonchemical insect control.

Widespread use of the mechanical harvester by farmers is probably some time away, but efforts by researchers likely will continue until a harvester that it efficient on small acreage is developed. Tobacco varieties suitable for mechanization will receive increased attention. As mechanization is adopted by farmers, more capital will be needed for tobacco production.

The labor shortage and competition for labor shorn on sign of easing and probably will intensify as tobaccomproducing areas become more industrialized. As a result more allotments may become underproduced. Lease and transfer, and sales of allotments would allow smallotments to be consolidated into larger more efficient production units. This may tend to shift tobaccomproduction to areas where production can be effectively mechanized.

⁶ Statistical relationship for 1940-69 is: All tobacco: $X_1 = 962.7 - 29.9 \ X_2 + 38.1 \ X_3 \ (R^2 = .94)$; Burley: $X_1 = 532.2 + 143.8 \ X_2 + 55.2 \ X_3 \ (R^2 = .94)$, Flue-cured: $X_1 = 1,107.0 - 48.0 \ X_2 + 36.5 \ X_3 \ (R^2 = .90)$. Where $X_1 = \text{yield}$, pounds per acre; $X_2 = \text{average size allotment}$; acres; $X_3 = \text{time}$, 1940 = 1. For projection purposes the trend of the past few years may be more useful than this 30-year average.
